Package Checklist

Please check your package which should include all items listed below.
If you find any item damaged or missed, please contact your supplier.

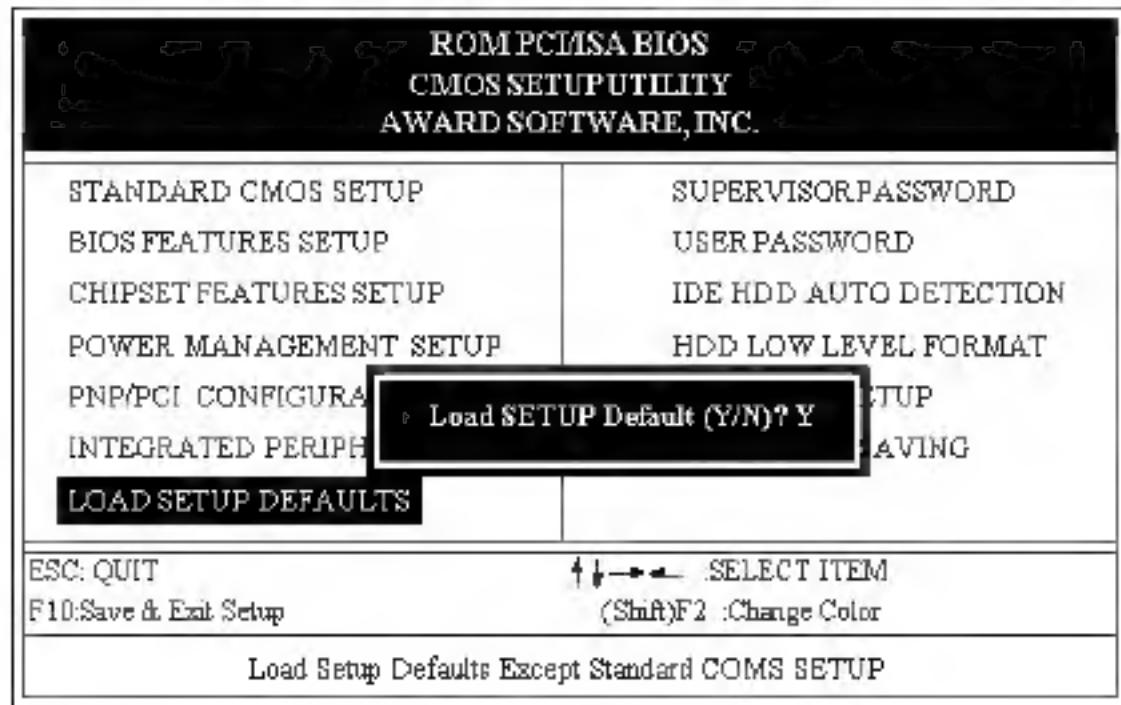

- One mainboard
- One manual
- One IDE ribbon cable
- One floppy ribbon cable
- One Parallel port ribbon cable
- One Serial port ribbon cable(COM1,COM2)
- One AGP driver diskette
- One Ultra_DMA IDE driver diskette

NOTE :

The "LOAD SETUP DEFAULTS" function loads the system default data directly from ROM and initializes the associated hardware properly. This function is necessary when you accept this mainboard, or the system CMOS data will corrupt.

LOAD SETUP DEFAULT

Chapter 1

Introduction

The EP-58VP3A mainboard is a high performance system hardware based on Intel Pentium processor and is equipped with an AGP slot, three PCI slots, three standard ISA slots, Super Multi-I/O controller and dual port PCI-IDE connectors for the future expansion. The hardware dimension is 220mm x 230mm with a four-layer-design technology.

Specification

- VIA Apollo VP3 AGP/PCIset chipset
- Intel Pentium[®] Processor, Pentium Processor with MMX Technology, AMD K5/K6, Cyrix 6x86L/6x86MX & I486 C6 operating at 90~333 MHz with 321 ZIF socket 7 provides scalability to accept faster Processors in the future.
- Supports up to 320 MegaBytes of memory (168-Pin DIMM x 2, 72-Pin SIMM x 2).
- Supports 512KB (Pipelined Burst SRAM) L2 Cache.
- Supports three 16 bit ISA slots, three 32 bit PCI slots, an AGP slot and provides two independent high performance PCI IDE interfaces capable of supporting PIO Mode 3/4 and Ultra-DMA33 devices
- Supports ATAPI (e.g. CD-ROM) devices on both IDE interfaces
- Supports a floppy port, a parallel port (EPP, ECP port), two serial ports (16550 Fast UART compatible), 1 USB Connector, a PS/2 style mouse connector and an AT style keyboard connector.
- Supports Award Plug & Play BIOS.
- Supports CPU Hardware sleep, APM (Advanced Power Management) and ACPI (Advanced Configuration Power Interface).
- Supports Switching Regulator for CPU power supply, and single jumper for CPU working voltage selection.
- Supports Dip switch for CPU selection.

Chapter 2

Hardware design

2-1 Mainboard Layout

The EP-S8VP3A is designed with VIA Apollo VP3 AGP/PCI set chipset which is developed by VIA Corporation to fully support Pentium® Processor PCI/ISA system. By providing a massive increase in the bandwidth available between the video card and the processor (66MHz), the unique feature of AGP supported by VIA Apollo VP3 chipset improves the speed of rendering and texturing for 3D graphics. The chipset also provides an integrated IDE controller with two high performance IDE interfaces for up to four IDE devices (hard devices, CD-ROM device, etc). The Winbond W83877F Super I/O controller provides the standard PC I/O function: one floppy interface, two 16 Byte FIFO serial ports and one EPP/ECP capable parallel port. The **EP-S8VP3A** layout is shown in the next page for user's reference. **Care** must be taken when inserting memory modules, CPUs or even plugging PCI card into associated slots to avoid damaging any circuits or sockets on board. A cooling fan is strongly recommended when installing Pentium/Pentium MMX/K5/K6/6x86L/6x86MX processor due to possible overheat.

The EP-S8VP3A supports a minimum of 8MB and a maximum of 320MB of System Memory while Onboard 512KB cache to increase system performance.

The EP-S8VP3A supports standard Fast Page, EDO (Extended Data Out or Hyper Page Mode) or synchronous DRAM. **The EP-S8VP3A** provides two 168-pin DIMM sites and two 72-pin SIMM sites for memory expansion. The sockets support 1Mx64(8MB), 2Mx64(16MB), 4Mx64(32MB), and 8Mx64(64MB) single-sided or double-sided memory modules. The memory timing requires 70 ns Fast page devices or 60 ns EDO DRAM (DRAM Modules may be parity [x 36] or non-parity [x 32]).

The EP-S8VP3A supports two Onboard PCI IDE connectors, and automatically detects IDE harddisk type by BIOS utility automatic.

The EP-S8VP3A supports Award Plug & Play BIOS for the ISA and PCI cards. The BIOS can be located in Flash EPROM which can replace BIOS code easily if necessary.

There is no deturbo function so that the turbo LED is always ON

Sleep/Resume switch - Push the button to enter the sleep mode.

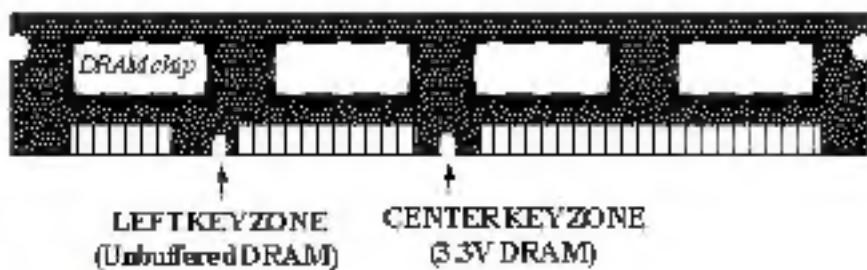

2-3 System Memory Configuration

The EP-58VP3A supports different type of settings for the system memory. The following figures and table provides all possible memory combinations.

SIMM 1 & 2 BANK 2	DIMM1 BANK 1	DIMM2 BANK 0	TOTAL MEMORY
<div style="border: 1px solid black; padding: 5px; display: inline-block;"> [8MB] [16MB] x2 [32MB] </div>	<div style="border: 1px solid black; padding: 5px; display: inline-block;"> [8MB] [16MB] [32MB] x1 [64MB] [128MB] </div>	<div style="border: 1px solid black; padding: 5px; display: inline-block;"> [8MB] [16MB] [32MB] x1 [64MB] [128MB] </div>	MAX=320MB

NOTE 1 : The KEY ZONE of the DIMM socket is 3.3V/Unbuffered.

[Back to Top](#)

2-4 Integrated PCI Bridge

The EP-58VP3A chip, VIA Apollo VP3 PCIset, is set to support Intel Pentium Processor PCI/ISA system. The VIA Apollo VP3 PCIset chipset consists of the 82C597AI system controller (TSC), and one 82C186B PCI/ISA/IDE Accelerator bridge chip. It provides an interface which translates PCI cycle into ISA bus cycle and vice versa, read/write capability. In addition, it provides fast performance and arbiter to support four PCI Masters, Rotating Priority Mechanism, and Hidden Arbitration Scheme Minimizes Arbitration Overhead.

There are four interrupts in each PCI slot: INTA# INT10# INT11# and INT12#. For the EP-58VP3A, adapts the PCI slot configuration with the system ROM SETUP utility. When the system is turned on after adding a PCI add-in card, the BIOS automatically configures up to 1 Mbytes of space and other parameters. You do not have to configure jumpers or worry about potential resource conflicts. Because PCI cards use the same interrupt/resource as ISA cards, you must specify the interrupt used by ISA add-in cards in the BIOS Setup utility.

However, if a 'Legacy card' such as plugging a parallel or serial card into ISA slot is plugged into the system, the slot can be ROM SETUP UTILITY becomes necessary. First of all, you must enter PCI CONFIGURATION SETUP utility from the ROM SETUP UTILITY main menu + set 'I' A for the 'PCI IDE IRQ MAP TO'.

Secondly, you must enter the CHIPSET FEATURES SETUP UTILITY & set the ROM SETUP UTILITY main menu and set 'Disabled' for the 'Onboard Primary PCI IDE' and the 'Onboard Secondary PCI IDE'. When you plug in a legacy card into the system, you should set 'I' cable' for the Onboard Primary and Secondary PCI IDE from the CHIPSET FEATURES SETUP UTILITY too.

You can set the system interrupt request (IRQ) on some 'Legacy cards' which have no provide card and cable. refer to user's manual of the card to a proper system. If a level is given at card, Primary is assigned to INTA and Secondary is assigned to INTB. If the card is plugged into slot 1 marked PCI#1, you cannot use second slot marked PCI#2 because the secondary PCI signal takes INTB from the slot. refer to Page 3-1 for more diagram. The user then enters the PCI CONFIGURATION SETUP utility from the ROM SETUP UTILITY main menu and set 'I' A for the PCI IDE IRQ MAP TO (This depends on the slot # where the legacy card is plugged).

CHAPTER 3

AWARD BIOS SETUP

Award's ROM BIOS provides a built-in setup program which allows user to modify the basic system configurations and hardware parameters. The modified data will be stored in a battery-backed CMOS RAM so that data will be retained even when the power is turned off. In general, the information saved in the CMOS RAM stays unchanged unless there is a configuration change in the system, such as a hard drive replacement or a new device installation.

If this does happen, you will need to reconfigure your configuration parameter.

To Enter Setup Program

Power on the computer and press **** key immediately. This will bring you into BIOS CMOSSETUPUTILITY.

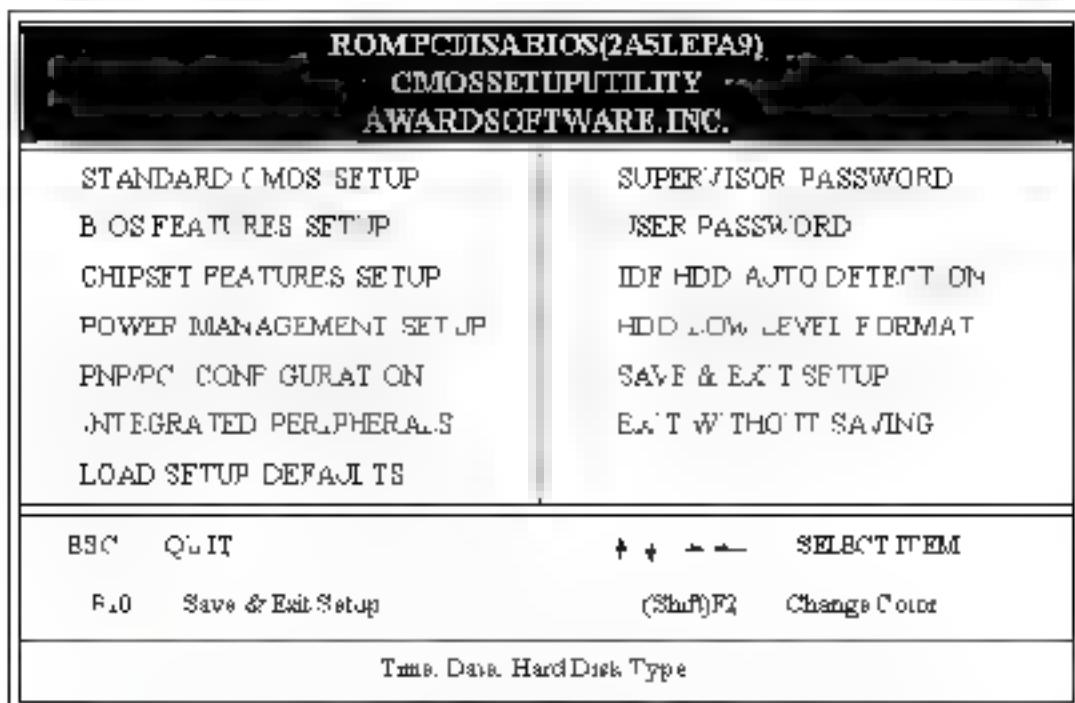

Figure 3-1 CMOS SETUPUTILITY

The menu displays all major selection items. Select the item you need to reconfigure. The selection is made by moving cursor, press any direction key to the item and press the **Enter** key. An on-line help message is displayed at the bottom of the screen as the cursor is moving to various items which provides a better understanding of each function. When a selection is made, the menu of selected item will appear so the user can modify the associated configuration parameters.

3-1 STANDARD CMOS SETUP

Choose "STANDARD CMOS SETUP" in the CMOS SETUP UTILITY menu (Fig 3).

The STANDARD CMOS SETUP allows user to configure system setting such as the current date and time, type of hard disk installed, floppy type and display type. Memory size is auto-detected by the BIOS and displayed for your reference. When a field is highlighted, use direction keys to move cursor and <Enter> key to select, the entries in the field will be changed by pressing <PgDn> or <PgUp> keys or user can enter new data directly from the keyboard.

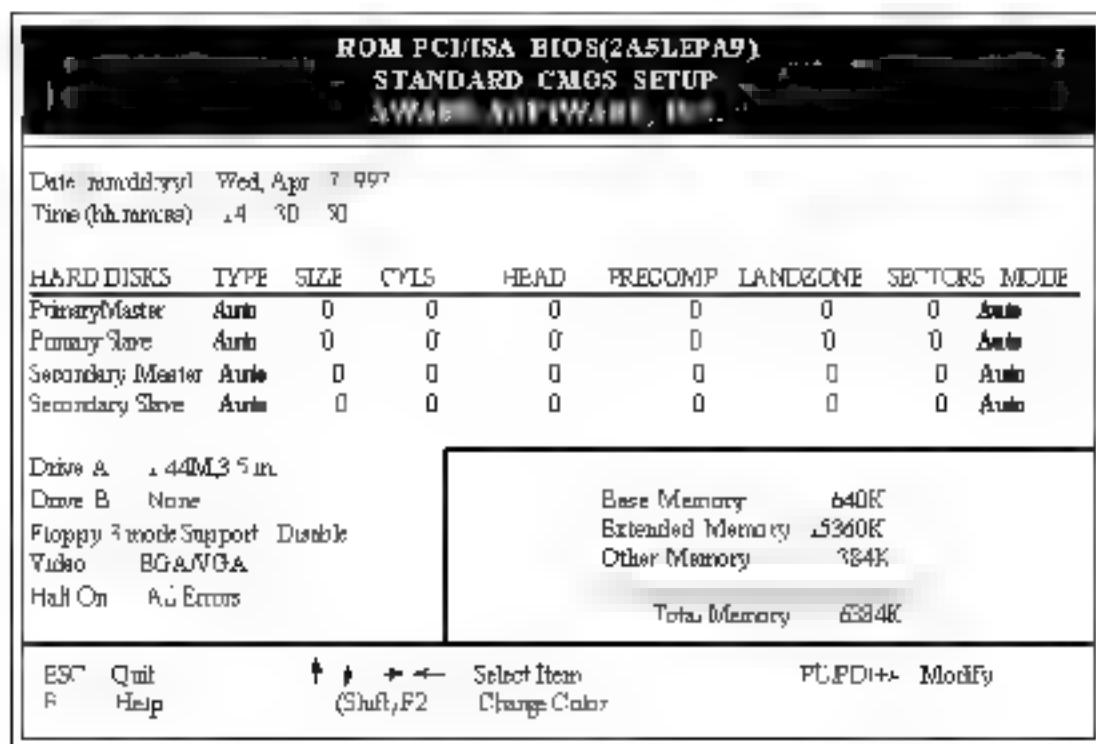

Figure 3-2 STANDARD CMOS SETUP

NOTE: If the Primary Master/Slave and the Secondary Master/Slave are set as "Auto", the hard disk size and mode will be auto-detected.

NOTE: The 'Halt On' field is to determine when to halt the system by the BIOS if an error occurs.

3-2 BIOS FEATURES SETUP

By selecting the 'BIOS FEATURES SETUP' option in the CMOS SETUP UTILITY menu, user can change system related parameters in the displayed menu. This menu shows all of the manufacturer's default values of the EP-5BVP3A. Again, user can move the cursor by pressing direction keys and <PgDn> or <PgUp> keys to modify the parameters. Pressing [F1] key to display help message of the selected item.

ROM PCLISA BIOS(2A5LEPA9) BIOS FEATURES SETUP AWARD SOFTWARE, INC.

Figure 3-3 BIOS FEATURES SETUP

Note The Security Option contains "setup" and "system". The "setup" indicates that the password setting is for CMOS only while the "system" indicates the password setting is for both CMOS and system boot up.

- **Virus Warning.** This category flashes on the screen During and after the system boots up any attempt to write to the boot sector or partition table of the hard disk drive will halt the system and an error message will appear. You should then run an anti-virus program to locate the virus. Keep in mind that this feature protects only the boot sector not the entire hard drive. Default value is **Disabled**.
 - Enabled:** Activates automatically when the system boots up causing a warning message to appear when any attempt to access the boot sector or hard disk partition table.
 - Disabled:** No warning message to appear when any attempt to access the boot sector or hard disk partition table.
- **CPU Internal Cache External Cache** These two categories speed up memory access. However it depends on CPU/chipset design. The default value is **Enabled**. If your CPU is without Internal Cache then this item "CPU Internal Cache" will not be shown.
 - Enabled:** Enable cache
 - Disabled:** Disable cache

- **Quick Power On Self Test** This category speeds up Power On Self Test (POST) after you power on the computer. If it is set to Enabled, BIOS will shorten or skip some checking items during POST.

Enabled : Enable a quick POST

Disabled : Normal POST

- **Boot Sequence**: This category determines which drive is searched first for the O/S(Operating System). The default value is A,C.
 - A,C* : The system will search for floppy disk drive first then hard disk drive
 - C,A* : The system will search for hard disk drive first then floppy disk drive
- **Swap Floppy Drive** This will swap your physical drive letters A&B if you are using two floppy disks. The default value is Disabled.
 - Enabled* : Floppy A & B will be swapped under the O/S
 - Disabled* : Floppy A & B will be not swapped

- **Boot Up Floppy Seek** During Power On Self Test (POST) BIOS will determine if the installed floppy drive is 40 or 80 tracks. Only 360K type is 40 tracks while 720K, 1.2M and 1.44M are all 80 tracks. The default value is Enabled.
 - Enabled* : BIOS searches for floppy disk drive to determine if it is 40 or 80 tracks. Note that BIOS cannot tell from 720K, 1.2M or 1.44M drive type as they are all 80 tracks.
 - Disabled* : BIOS will not search for the type of floppy disk drive by track number. Note that there will not be any warning message if the drive installed is 360K.

- **Boot Up NumLock Status** The default value is On.
 - On* : Keypad is number keys
 - Off* : Keypad is arrow keys

- **Boot UP System Speed**: Select default system speed. The system will run at the selected speed after the system boots.
 - High* : Set the speed to high
 - Low* : Set the speed to low

- **Gate A20 Option** This refers to the way the system addresses memory above 1MB (extended memory). The default value is Fast.
 - Normal* : The A20 signal is controlled by keyboard controller or chipset hardware
 - Fast* : The A20 signal is controlled by Port 92 or chipset specific method.

- **Typematic Rate Setting:** This determines the typematic rate
 - Enabled:** Enable typematic rate and typematic delay programming
 - Disabled:** Disable typematic rate and typematic delay programming. The system BIOS will use default value of 2 items and the default is controlled by the keyboard
- **Typematic Rate(Chars/Sec):**

6: 6 characters per second	8: 8 characters per second
10: 10 characters per second	12: 12 characters per second
15: 15 characters per second	20: 20 characters per second
24: 24 characters per second	30: 30 characters per second
- **Typematic Delay(Msec):** This determines the time between the first and second character displayed, when holding a key
 - 250: 250msec
 - 500: 500msec
 - 750: 750msec
 - 1000: 1000msec
- **Security Option:** This category allows you to limit access to the system and Setup or just to Setup. The default value is Setup
 - System:** The system will not boot and the access to Setup will be denied if the correct password is not entered at the prompt
 - Setup:** The system will boot, but the access to Setup will be denied if the correct password is not entered at the prompt
- **PCI/VGA Palette Snoop:** This field controls the ability of a primary PCI VGA controller to share a common palette when a snoop write cycles with an ISA video card. The default value is Disabled.
 - Enabled:** If an ISA card connects to a PCI/VGA card via the VESA connector and the ISA card connects to VGA monitor and uses the RAMDAC of PCI card, the PCI/VGA Palette Snoop is enabled
 - Disabled:** Disable the VGA card Palette snoop function
- **Video BIOS Shadow:** It determines whether video BIOS will be copied to RAM. However, it's optional from chipset design. Video Shadow will increase the video speed.
 - Enabled:** Video shadow is enabled
 - Disabled:** Video shadow is disabled

- C0000 CFFFF Shadow:
- C0000 CFFFF Shadow:
- D0000 D3FFF Shadow:
- D4000 D7FFF Shadow:
- D8000 DBFFF Shadow:
- DC000 DFFFF Shadow:

These categories determine whether optional ROM will be copied to RAM by 16K byte or 32K byte per unit and the size depends on the chipset.

Enabled: Optional shadow is enabled.

Disabled: Optional shadow is disabled.

3.3 CHIPSET FEATURES SETUP

Choose the "CHIPSET FEATURES SETUP" in the CMOS SETUP UTILITY menu to display the following menu.

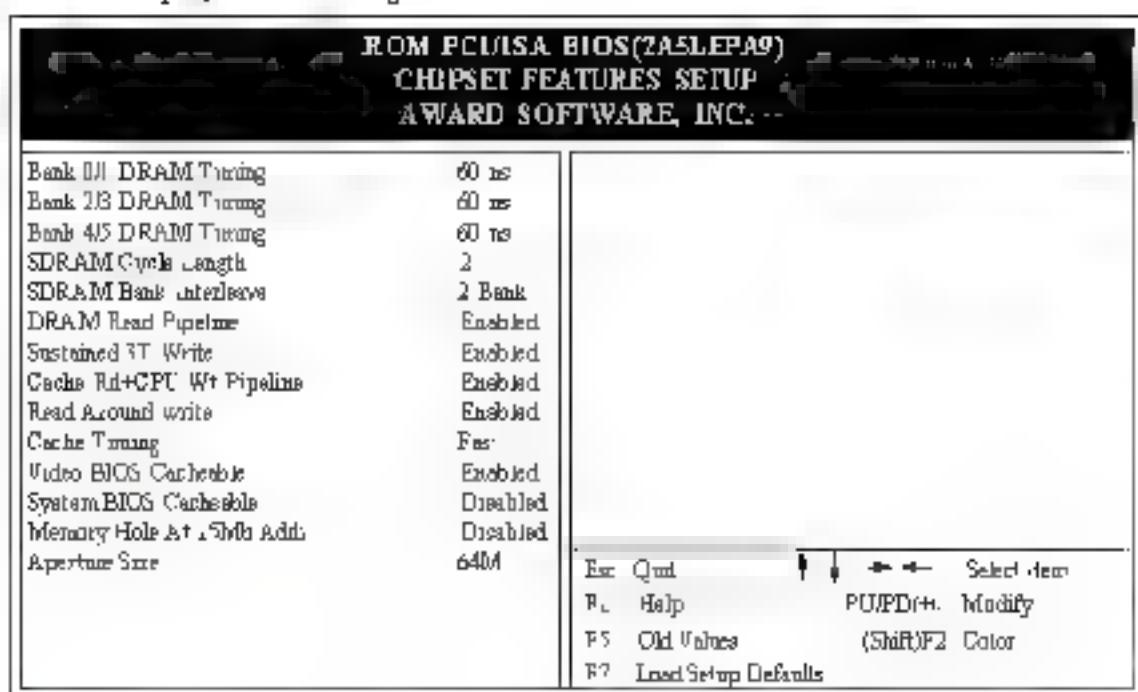

Figure 3-4 CHIPSET FEATURES SETUP

Note: When you insert slower memory modules in the system and set a faster timing, maybe the system will hang up

- **DRAM Timing:** The default value is 60ns.
60ns: 2 (faster) Burst Wait State, for 60~70ns Fast Page Mode/EDO DRAM
70ns: 3 (slower) Burst Wait State, for 70ns Fast Page Mode/EDO DRAM
- **Video BIOS Cacheable:** The default value is Enabled.
Enabled: Enabled the Video BIOS Cacheable to speed up the VGA Performance.
Disabled: Disabled the Video BIOS Cacheable function.
- **Memory Hole at 15M-16M:** The default value is Disabled.
Disabled: Normal Setting
Enabled: This field enables the main memory (15~16MB, remap to ISA BUS).

[Back to top](#)

3.4 POWER MANAGEMENT SETUP

Choose the 'POWER MANAGEMENT SETUP' in the CMOS SETUP UTILITY to display the following screen. This menu allows the user to modify the power management parameters and IRQ signals. In general, these parameters should not be changed unless it is absolutely necessary.

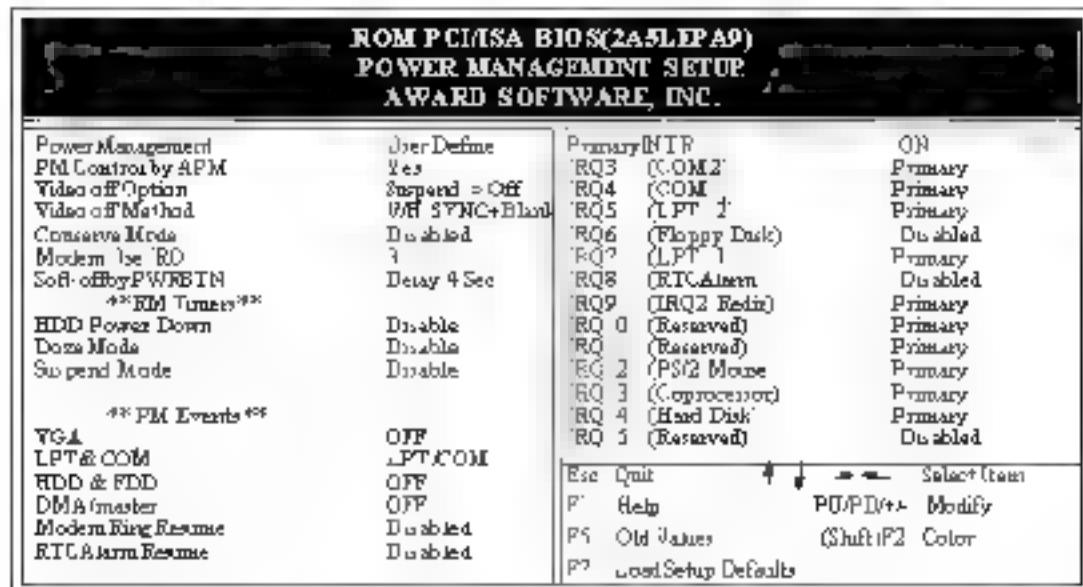

Figure 3-5 POWER MANAGEMENT SETUP

Again, users can move the cursor by pressing direction keys to the field needed to be modified and press <PgDn> or <PgUp> to alter item selection. You can only change the content of **Dose Mode**, **Standby Mode**, and **Suspend Mode** when the **Power Management** is set to **User Define**.

3.3.1 The Description of the Power Management

A Power Management mode selection

Disabled The system operates in NORMAL conditions (Non GREEN) and the Power Management function is disabled.

Max. saving: This mode will maximize the power saving capability.

Min. saving: This mode will minimize the power saving capability.

User define: Allow user to define time out parameters to control power saving mode. Refer to item B shown below.

B. Time-out parameters**HDD Standby**

HDD Standby timer can be set from 1 to 15 minute(s)

System Doze

The "System Doze" mode timer starts to count when there is no "PM events" occurred. The valid time-out setting is from 1 minute up to 1 hour

System Suspend

This function works only when the Pentium Processor is installed. The timer starts to count when "System Standby" mode timer is timed out and no "PM Events" occurred. Valid range is from 1 minute up to 1 hour

3-3-2 Description of the Green Functions

The **P44VP3** supports HDD Power Down, Doze and Suspend power saving functions. In addition, the hardware suspend function is supported when the J3 (12-13) (Refer to Figure2) is closed to enter the Suspend function.

The detailed description of these functions is provided in the next page

HDD Standby Mode

When system stops reading or writing HDD, the timer starts to count. The system will cut off the HDD power when timer runs out of time. The system will not resume operation until either a read from or a write to HDD command is executed again.

Doze Mode

The system hardware will drop down CPU work from normal working speed when Doze mode time-out occurs

Suspend Mode

When the system suspend timer times out, the system will enter the suspend mode and the chipset will stop CPU clock immediately. The power consumption in Suspend Mode is lower than in standby mode. The screen is also blanked out.

PMEvents:

AWARD BIOS defines 7 PM Events in the power management mode (Doze & suspend). The user can enable any PM Events to be "Enable" or "Disable". When the system detects all of the enabled events do not have any activity it will start the system Doze timer first if the "Power Management" is not "Disabled". Once the system Doze timer is turned out, it will process doze power saving procedure by starting the system suspend timer. When the suspend timer times out all of the CPU clock will stop by dropping system clock down to zero and remains this way until any one of the "Enabled" event occurs.

3-5 PNP/PCI CONFIGURATION

The PNP/PCI configuration program is for the user to modify the PCI/ISA IRQ signals when various PCI/ISA cards are inserted in the PCI or ISA slots.

WARNING Any misplacing IRQ could cause system can't pick out the resources.

ROM PCI/ISA BIOS(2A5LEPA9) PNP/PCI CONFIGURATION AWARD SOFTWARE, INC.			
PNP Installed	No	CPU to PC Write Buffer	Enabled
Resources Controlled By	Manual	PCI Dynamic Bursting	Enabled
Resource Configuration Data	Disabled	PCI Master 0 WS Write	Enabled
IRQ 3 assigned to	Legacy ISA	PCI Delay Transaction	Enabled
IRQ 4 assigned to	Legacy ISA	PCI Master Read Prefetch	Enabled
IRQ 5 assigned to	PCI/ISA PnP	PCI/ISA Access #1 Retry	Disabled
IRQ 7 assigned to	Legacy ISA	AGP Master 1 WS Write	Enabled
IRQ 9 assigned to	PCI/ISA PnP	AGP Master 1 WS Read	Disabled

DMA 3 assigned to	PCI/ISA PnP	F3 No Change	(Shift) F2 Color
DMA 5 assigned to	PCI/ISA PnP	F7 Load Setup Defaults	
DMA 6 assigned to	PCI/ISA PnP		
DMA 7 assigned to	PCI/ISA PnP		

Figure 3-6 PCI CONFIGURATION SETUP

♦ **Resource Controlled By**: The default value is **Manual**.

Manual: The field defines that the PNP Card's resource is controlled by **manual**. You can setup whether IRQ-X or DMA-X is assigned to PCI/ISA PNP or Legacy ISA Cards.

Auto: If your ISA card and PCI card are all PNP cards. Set this field to 'Auto'. The BIOS will assign the interrupt resource automatically.

♦ **Reset Configuration Data**: The default value is **Disabled**.

Disabled: Normal Setting

Enabled: If you plug some Legacy cards in the system and record into ESCD (Extended System Configuration Data). You can set this field to be **Enabled** and to clear ESCD at one time when some Legacy cards are removed.

♦ **PCI IDE IRQ Map To**: The default value is **PCI AUTO**.

When you have true PCI cards plugged into the system, you will not need to change any thing here in the **SETUP** program. However, if you do not know whether you are using a true PCI card, please refer to your PCI card user's manual for the details.

When you have a Legacy card described in section 2.5 to plug into the system, a proper setting is extremely important or it may cause the system hung up. The diagram shown below tells you how the Rotating Priority Mechanism is designed.

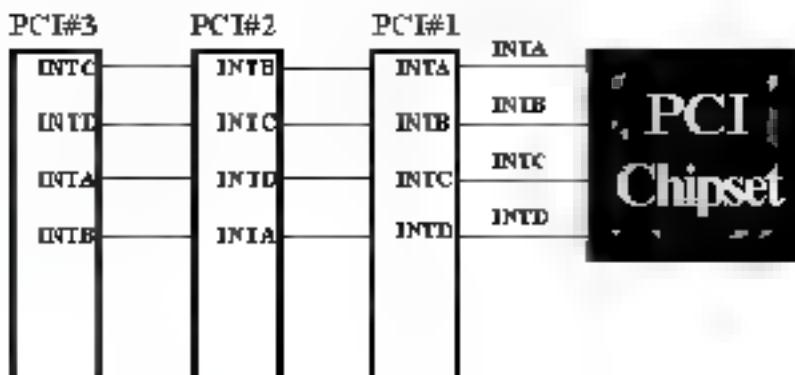

Figure 3-7 The Combination of PCI INT# lines

3.6 INTEGRATED PERIPHERALS

ROM PCI/ISA BIOS(2ASLEPAP)			
INTEGRATED PERIPHERALS			
WARD SOFTWARE, INC.			
Onboard Primary PCI IDE	Enabled	Onboard Parallel Port	IRQ5/IRQ7
Onboard Secondary PCI IDE	Enabled	Onboard Parallel Mode	ECP EPP

Onboard Serial Port 2	Auto	F2 No Change	(Shift) F2 Color
UART 2 Mode	Standard	F3 Load Setup Defaults	

Note: If you don't use the Onboard IDE connector, but use On-card (PCI or ISA card) IDE connector You have to set Onboard Primary PCI IDE Disabled and Onboard Secondary PCI IDE Disabled from CHIPSET FEATURES SETUPUTILITY
The Onboard PCI IDE cable should be equal to or less than 18 inches (45 cm.).

- **IDE HDD Block Mode:** The default value is Enabled
Enabled : Enable IDE HDD Block Mode The HDD transfer rate is better than Disable
Disabled : Disable IDE HDD Block Mode
- **PCI Slot IDE 2nd Channel:** The default value is Enabled
Enabled : Enable secondary IDE port and BIOS will assign IRQ15 for this port
Disabled : Disable a secondary IDE port and IRQ 5 is available for other device
- **Onboard Primary PCI IDE:** The default value is Enabled
Enabled : Enable Onboard 1st channel IDE port
Disabled : Disable Onboard 1st channel IDE port When use On-card (PCI or ISA card) IDE connector
- **Onboard Secondary PCI IDE:** The default value is Enabled
Enabled : Enable Onboard 2nd channel IDE port
Disabled : Disable Onboard 2nd channel IDE port When use On-card (PCI or ISA card) IDE connector

- **IDE Primary Master PIO:** The default value is *Auto*
 - Auto* BIOS will automatically detect the Onboard Primary Master PCI IDE HDD Accessing mode
 - Mode0~4* Manual, set the IDE Accessing mode
- **IDE Primary Slave PIO:** The default value is *Auto*
 - Auto* BIOS will automatically detect the Onboard Primary Slave PCI IDE HDD Accessing mode
 - Mode0~4* Manual, set the IDE Accessing mode
- **IDE Secondary Master PIO:** The default value is *Auto*
 - Auto* BIOS will automatically detect the Onboard Secondary Master PCI IDE HDD Accessing mode
 - Mode0~4* Manual, set the IDE Accessing mode
- **IDE Secondary Slave PIO:** The default value is *Auto*
 - Auto* BIOS will automatically detect the Onboard Secondary Slave PCI IDE HDD Accessing mode
 - Mode0~4* Manual, set the IDE Accessing mode
- **Onboard FDC Controller:** The default value is *Enabled*.
 - Enabled* Enable the Onboard Floppy drive interface controller
 - Disabled* Disable the Onboard floppy drive interface controller
When using On-card ISA FDC's controller
- **Onboard UART 1:** This field allows the user to select the serial port. The default value is *3F8H/IRQ4*
 - COM1* Enable Onboard Serial port 1 and address is 3F8H/IRQ4
 - COM2* Enable Onboard Serial port 1 and address is 2F8H/IRQ3
 - COM3* Enable Onboard Serial port 1 and address is 3E8H/IRQ4
 - COM4* Enable Onboard Serial port 1 and address is 2E8H/IRQ3
 - Disabled* Disable Onboard Serial port 1
- **Onboard UART 2:** This field allows the user to select the serial port. The default value is *2F8H/IRQ3*
 - COM1* Enable Onboard Serial port 2 and address is 3F8H/IRQ4
 - COM2* Enable Onboard Serial port 2 and address is 2F8H/IRQ3
 - COM3* Enable Onboard Serial port 2 and address is 3E8H/IRQ4
 - COM4* Enable Onboard Serial port 2 and address is 2E8H/IRQ3
 - Disabled* Disable Onboard Serial port 2

- **Onboard UART 2 Mode** The default value is standard. This field allows the User to select the COM2 port that can support a serial Infrared Interface

Standard: Support a Serial Infrared Interface IrDA

HPSIR: Support a HP Serial Infrared Interface format

ASKIR: Support a Sharp Serial Infrared Interface format

- **Onboard Parallel port** This field allows the user to select the LPT port. The default value is 378H IRQ7

378H Enable Onboard LPT port and address is 378H and IRQ7

278H Enable Onboard LPT port and address is 278H and IRQ5

3BC_H Enable Onboard LPT port and address is 3BC_H and IRQ7

Disabled Disable Onboard LPT port

NOTE: Parallel Port address is 378H/3BC_H that selects the routing of IRQ7 for LPT1

Parallel Port address is 278H that selects the routing of IRQ5 for LPT1

- **Parallel port Mode:** This field allows the user to select the parallel port mode. The default value is ECP+EPP

Normal Standard mode IBM PC AT Compatible bidirectional parallel port

EPP Enhanced Parallel Port mode

ECP Extended Capability Port mode

EPP+ECP ECP Mode & EPP Mode

ECP Mode USE DMA. This field allows the user to select DMA1 or DMA3 for the ECP mode. The default value is DMA3

DMA1 The field selects the routing of DMA1 for the ECP mode

DMA3 The field selects the routing of DMA3 for the ECP mode

3-7 LOAD SETUP DEFAULTS

The "LOAD SETUP DEFAULTS" function loads the system default data directly from ROM and initializes the associated hardware properly. This function will be necessary only when the system CMOS data is corrupted.

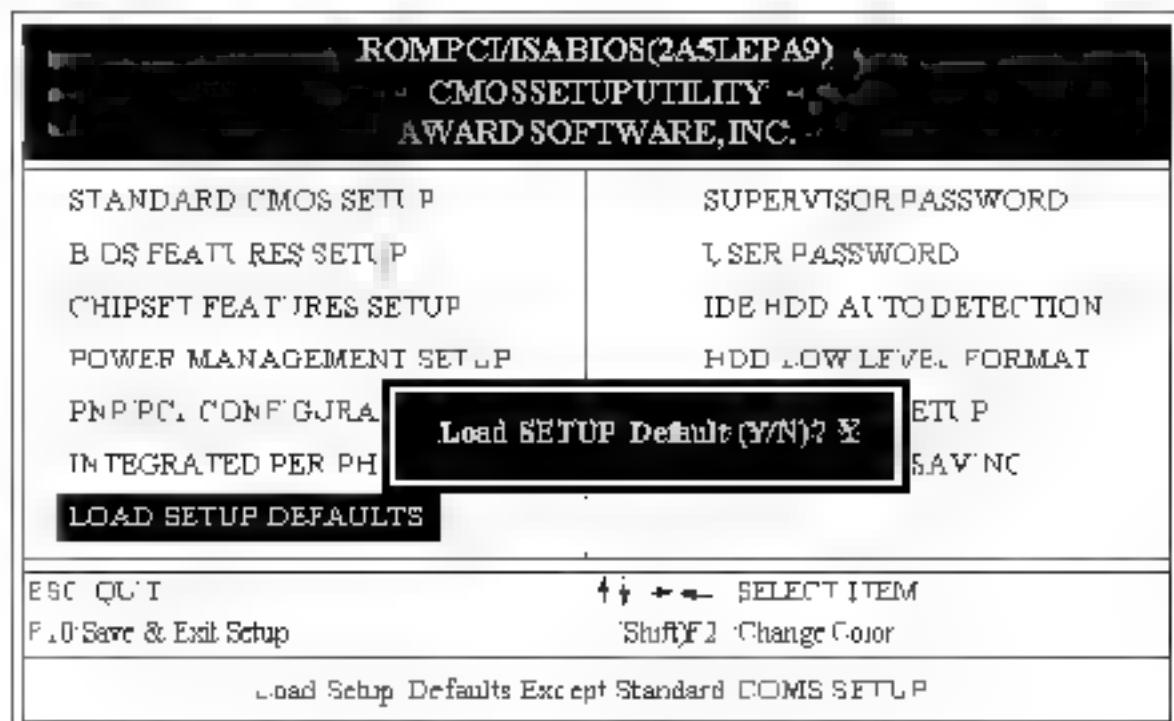

Figure 3-8 LOAD SETUP DEFAULT

3-8 CHANGE SUPERVISOR or USER PASSWORD

To change the password, choose the 'SUPERVISOR PASSWORD or USER PASSWORD' option from the CMOS SETUP UTILITY menu and press Enter].

NOTE Either "Setup" or "System" must be selected in the "Security Option" of the BIOS FEATURES SETUP menu (Refer to Figure 3-3 for the details).

- 1 If CMOS is corrupted or the option is not used a default password stored in the ROM will be used. The screen will display the following message

Enter Password:

Press the [Enter] key to continue after proper password is given

- 2 If CMOS is corrupted or the option was used earlier and the user wish to change default password, the SETUP UTILITY will display a message and ask for a confirmation

Confirm Password:

- 3 After pressing the [Enter] key (ROM password if the option was not used) or current password (user defined password) the user can change the password and store new one in CMOS RAM. A maximum of 8 characters can be entered.

3-9 IDE HDD AUTO DETECTION

The "IDE HDD AUTO DETECTION" utility is a very useful tool especially when you do not know which kind of hard disk type you are using. You can use this utility to detect the correct disk type installed in the system automatically. But now you can set **HARD DISK TYPE** to **Auto** in the **STANDARD CMOS SETUP**. You do not need the "IDE HDD AUTO DETECTION" utility. The BIOS will Auto-detect the hard disk size and mode on display during POST.

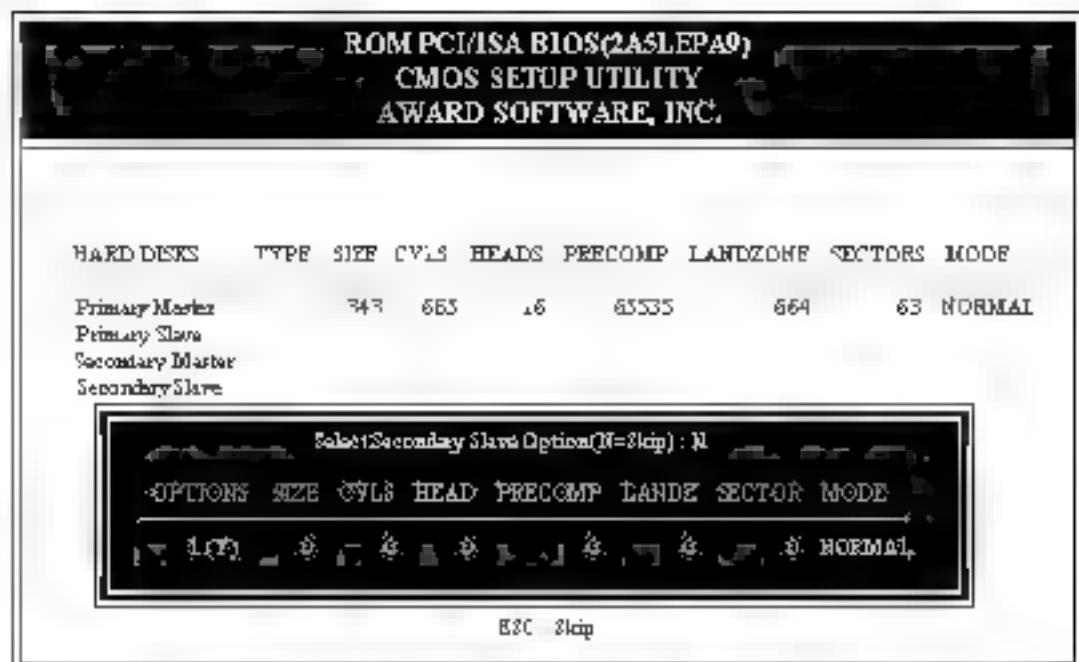

Figure 3-9 IDE HDD AUTO DETECTION

NOTE: HDD Modes

The Award BIOS supports 3 HDD modes: NORMAL, LBA and LARGE. NORMAL mode

Generic access mode that is neither the BIOS nor the IDE controller will make transformations during accessing.

The maximum numbers of cylinders, head & sectors for NORMAL mode are 024, 16 and 63.

no Cylinder	1024
no Head	16)
no Sector	63)
no persector	512)

512 Megabytes

If an user sets the HDD to NORMAL mode, the maximum accessible HDD size will be 512 Megabytes even though its physical size may be greater than that.

LBA (Logical Block Addressing) mode: This is a new HDD accessing method to overcome the 512 Megabyte bottleneck.

The number of cylinders, heads and sectors shown in the setup may not be the number physically contained in the HDD.

During the HDD accessing, the IDE controller will transform the logical address described by sector, head and cylinder into its own physical address inside the HDD.

The maximum HDD size supported by LBA mode is 8.4 Gigabytes which is obtained by the following formula:

$$\begin{array}{rcl}
 \text{no Cylinder} & 1024 \\
 \times \text{no Head} & 255 \\
 \times \text{no Sector} & 63 \\
 \times \text{bytes per sector} & (512) \\
 \hline
 & 8.4 \text{ Gigabytes}
 \end{array}$$

LARGE mode: This is an extended HDD access mode supported by Award Software.

Some IDE HDDs contain more than 1024 cylinders without LBA support. In some cases user does not want LBA. The Award BIOS provides another alternative to support these kinds of LARGE mode.

CYLS.	HEADS	SECTOR	MODE
1120	16	59	NORMAL
160	32	59	LARGE

BIOS tricks DOS or other OS that the number of cylinders is less than 1024 by dividing it by 2. At the same time the number of heads is multiplied by 2. A reverse transformation process will be made in the INT 12h in order to access the right HDD address.

Maximum HDD size:

$$\begin{array}{rcl}
 \text{no Cylinder} & 1024 \\
 \times \text{no Head} & 32 \\
 \times \text{no Sector} & 63 \\
 \times \text{bytes per sector} & (512) \\
 \hline
 & 1 \text{ Gigabytes}
 \end{array}$$

Note

To support LBA or LARGE mode of HDDs there must be some softwares involved. All softwares are located in the Award HDD Service Routine - NT13h. It may fail to access a HDD with LBA (LARGE) mode selected if you are running under on Operating System which replaces the whole NT 13h. UNIX operating systems do not support either LBA or LARGE and must utilize the Standard mode. UNIX can support drives larger than 528MB.

3-10 HDD LOW LEVEL FORMAT**Interleave**

Select the interleave number of the hard disk drive that you wish to perform a low level format on. You may select from 1 to 8. Check the documentation that came with the drive for the correct interleave number, or select 0 for automatic detection.

Auto scan bad track

This allows the utility to scan first then format by each track

Start

Press <Y> to start low level format

3-11 SAVE & EXIT SETUP

The "SAVE & EXIT SETUP" option will bring you back to boot up procedure with all the changes you just recorded in the CMOS RAM.

3-12 EXIT WITHOUT SAVING

The "EXIT WITHOUT SAVING" option will bring you back to normal boot up procedure without saving any data into CMOS RAM. All old data in the CMOS will not be destroyed.

Chapter 4

Technical Information

4.1 I/O & MEMORY MAP

MEMORY MAP

Address Range	Size	Description
[0000-7FFF]	5.2K	Conventional memory
[8000-9FBFF]	127K	Extended Conventional memory
[9FC00-9FFFF]	.1K	Extended B-OS data area if PS/2 mouse is installed
[A0000-C7FFF]	.160K	Available for Hi-DOS memory
[C8000-DFFFF]	96K	Available for Hi-DOS memory and adapter ROMs
[E0000-EFFFF]	60K	Available for VUMB
[FF000-FFFFF]	4K	Video service routine for Monochrome & CGA adaptor
[F0000-F7FFF]	32K	B-OS CMOS setup utility
[F8000-FCFFF]	20K	B-OS runtime service routine (2)
[FD000-FDFFF]	4K	Plug and Play ESCD data area
[FE000-FFFFF]	8K	B-OS runtime service routine

I/O MAP

[000-01F]	DMA controller Master
[020-021]	INTERR PT CONTROLLER Master)
[022-023]	CHIPSET control registers I/O ports
[040-05F]	I-MER control registers
[060-06F]	KEYBOARD interface controller (8042)
[070-07F]	RTC ports & CMOS I/O ports
[080-09F]	DMA register
[0A0-0BF]	INTERR IPT controller Slave
[0C0-0DF]	DMA controller Slave
[0F0-0FF]	MATH COPROCESSOR
[1F0-1F8]	HARD DISK controller

	30	Reserved for extension memory low byte
	31	Reserved for extension memory high byte
	32	DATE CENTURY byte
	33	INFORMATION FLAG
	34-3F	Reserve
	40-FF	Reserved for CHIP SET SETTING DATA

APPENDIX A: POST CODES

ISA POST codes are typically output to port address 80h

POST(hex) DESCRIPTION

01-02 Reserved

C0 Turn off OEM specific cache, shadow

03

- 1 Initialize EISA registers (EISA B OS only)
- 2 Initialize all the standard devices with default values. Standard devices includes
 - DMA controller '8237'
 - Programmable interrupt Controller (8259)
 - Programmable Interval Timer '8254'
 - RTC chip

04 Reserved

05

- 1 Keyboard Controller Self Test
- 2 Enable Keyboard Interface

06 Reserved

07 verifies CMOS's basic R/W functionality

C1 Auto-detection of onboard DRAM & Cache

C5 Copy the BIOS from ROM into E0000 FFFF shadow RAM so that POST will go faster

08 Test the First 256K DRAM

09 OEM specific cache initialization (if needed)

0A

- 1 Initialize the first 12 interrupt vectors with corresponding interrupt handlers
 - Initialize INT no from 3~10 with Dummy 'Suprious' interrupt Handler
- 2 Issue CPUID instruction to identify CPU type
- 3 Early Power Management initialization OEM specific

0B

- 1 Verify the RTC time is valid or not
- 2 Detect bad battery
- 3 Read CMOS data into B OS stack area
- 4 PnP initializations including PnP B OS only
 - Assign CSM to PnP ISA card
 - Create resource map from FSCD
- 5 Assign IO & Memory for PCI devices PC BIOS only

POST(hex) DESCRIPTION

0C Initialization of the BIOS Data Area (40:0N - 40:FF)

0D

- 1 Program some of the Chipset's value according to Setup (Early Setup Value Program)
- 2 Measure CPU speed for display & decide the system clock speed
- 3 Video initialization including Monochrome, CGA, EGA/VGA. If no display device found, the speaker will beep

0E

- 1 Test video RAM (if Monochrome display device found)
- 2 Show messages including
 - Award Logo, Copyright string, BIOS Data code & Part No
 - OEM specific sign on messages
 - Energy Star Logo, Green BIOS ONLY
 - CPU brand, type & speed
 - Test system BIOS checksum (Non Compressed version only)

0F DMA channel 0 test

10 DMA channel 1 test

11 DMA page registers test

12-13 Reserved

14 Test 8254 Timer 0 Counter 2

15 Test 8259 interrupt mask bus for channel 1

16 Test 8259 interrupt mask bits for channel 2

17 Reserved

19 Test 8259 functionality

1A-1D Reserved

1E If EISA NVM checksum is good, execute EISA initialization. (EISA BIOS only)

1F-29 Reserved

30 Detect Base Memory & Extended Memory Size

31

- 1 Test Base Memory from 256K to 640K
- 2 Test Extended Memory from 1M to the top of memory

POST(hex) DESCRIPTION

32 1. Display the Award Plug & Play B OS Extension message (PnP B OS only)
 2. Program all onboard super I/O chips (if any) including COM ports, LPT ports, FDD port according to setup value

33-3B Reserved

3C Set flag to allow users to enter CMOS Setup Utility

3D 1. Initialize Keyboard
 2. Install PS/2 mouse

3E Try to turn on Level 3 cache
 Note: Some chipset may need to turn on the L3 cache in this stage. But usually the cache is turn on later in POST 6h

3F-40 Reserved

4F Program the rest of the Chipset's value according to Setup 'Later Setup Value Program'
 2. Auto-configuration is enabled, programmed the chipset with pre-defined values

41 Initialize floppy disk drive controller

42 Initialize Hard drive controller

43 If it is a PnP BIOS, initialize serial & parallel ports

44 Reserved

45 Initialize math coprocessor

46-4D Reserved

4E If there is any error detected, such as video fb on the screen & wait for user to press <F1> key to show all the error messages

4F 1. If password is needed, ask for password
 2. Clear the Energy Star Logo (Green B OS only)

50 Write all CMOS values currently in the BIOS stack area back into the CMOS

51 Reserved

POST(hex) DESCRIPTION

52 Initialize all ISA ROMs
 1 Layer PCI initializations (PCI BIOS only)
 assign IRQ to PCI devices
 initialize all PCI ROMs
 2 PnP Initializations (PnP BIOS only)
 assign I/O, Memory, IRQ & DMA to PnP ISA devices
 initialize all PnP ISA ROMs
 3 Program shadows RAM according to Setup settings
 4 Program parity according to Setup setting
 5 Power Management Initialization
 Enable/Disable global PM
 APM interface initialization

53 If it is NOT a PnP BIOS initialize serial & parallel ports
 1 Initialize time value in BIOS data area by translate the RTC time value into a timer tick value

60 Setup Virus Protection (Boot Sector Protection) functionality according to Setup setting

61 1 Try to turn on Level 2 cache
 Note: if L2 cache is already turned on in POST 3D this part will be skipped.
 2 Set the boot up speed according to Setup setting
 3 Last chance for Chipset initialization
 4 Last chance for Power Management initialization (new BIOS only)
 5 Show the system configuration table

62 Setup daylight saving according to Setup value
 1 Program the NMI clock, typemask rate & typematic speed according to Setup setting

63 If there is any changes in the hardware configuration, update the ESCD information (PnP BIOS only)
 1 Clear memory that have been used
 2 Boot system via INT 9H

FF System Booting. This means that the BIOS already pass the control right to the operating system.

Unexpected Errors:**POST(hex) DESCRIPTION**

B0 If interrupt occurs in protected mode

B1 Unclaimed NMI occurs

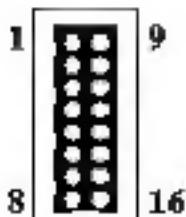

APPENDIX B: I/O CONNECTORS

J1:PS2/MOUSE CONNECTOR:

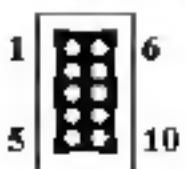

1. DATA
2. CLK
3. GND
4. NC
5. VCC

CN1: USB CONNECTOR:

Appendix C : AGP Driver for Windows 95 Installation Guide

This section provides the information for installation of EP-58VP3AVxD Driver which supports Accelerated Graphics Port (AGP) functionalities

SYSTEM REQUIREMENTS

- 1 Microsoft Windows 95 OSR2.1 (OSR2.0 with USB upgrade)
- 2 VIA Apollo VP3 AGP Driver (Vgart VxD)
- 3 AGP VGA Card with Driver
- 4 DirectX5 DDK or SDK

INSTALLATION PROCEDURE

- Step 1. Install Windows 95 4.00.950 B or later version
- Step 2. Install USBSUPP (USB upgrade)
- Step 3. Install Apollo VP3 AGP Driver
 - run the program "SETUP.EXE" which can be found in the VIA VxD driver disk and this process will then automatically install the VIA VxD driver onto your windows 95 system.
- Step 4. Install VGA driver for Windows 95
- Step 5. Install Microsoft DirectX5 DDK or SDK

NOTES

1. This driver should be installed on a system with the VIA AGP chipset, VT82C597 or later, while other chipsets is not be supported. The VIA VxD Driver is only supported by Windows 95 OSR2.0 (4.00.950 B) or later versions.
2. For Win95 users, you will need to
 - a. Get "USBSUPP.EXE" from Microsoft (www.microsoft.com), which includes the USB supplement and a new memory manager (VMM32.VxD) needed for the AGP DIME (Direct Memory Execute) feature.
 - b. Get DirectX 5.0 from Microsoft (www.microsoft.com). DirectX 5.0 is the first DirectX version that supports AGP's DIME.
 - c. Get "VIAGART.VXD", a virtual device manager which is usually installed during the installation procedure of the Windows 95 card driver
3. To make sure if the Apollo VP3 AGP driver is properly installed, one must boot the Windows 95 system up and run "Regedit" and check whether the file VIAGART exists in the following path
"HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\VxD"
4. To check whether the AGP driver is able to activate, one must do the following:
 - a. Activate the "Control Panel"

- b. Click on 'Direct X' then
- c. Click on 'Direct Draw' and
- d. Check if there are some values existing in the 'Bit' and 'overlays.' If there is, that means the AGP can be activated properly

REPLACING AN EXISTING VGA CARD WITH THE AGP VGA CARD

1. Shut down the computer and then turn off the power
2. Replace the VGA card boot up the system once again
3. Now, Update Device Driver Wizard Window will appear. This wizard will complete the installation of the Standard PCI Graphics Adapter (VGA). Click **Next >** to let Windows search for an updated driver

WARING! Only click **Next >. The system will hang if you click **Cancel**!**

4. Click **Finish** to install the VGA driver. You will then be asked for your Windows 95 CD in order to complete the VGA driver installation. If you do not have your CD handy, direct the installation path to your **Windows\System** directory. Windows will prompt you to restart your windows. Choose **'NO'** and install the appropriate AGP VGA Driver

Back to Top
